Session PLAN

01

We will talk about perfect commits first.

02

We will talk about rebase + interactive rebase vs merge second.

03

Then, we will talk about cherry picking (without Spectre).

04

After that we will talk about searching and reflog.

05

We will also talk about fixing conflicts with GUI.

06

And we will talk about submodules last.

01 Committing to Commit

In this section we'll explore things related to A perfect commit

slidesmania.com

A PERFECT commit

```
<p> A perfect commit contains two things </p>

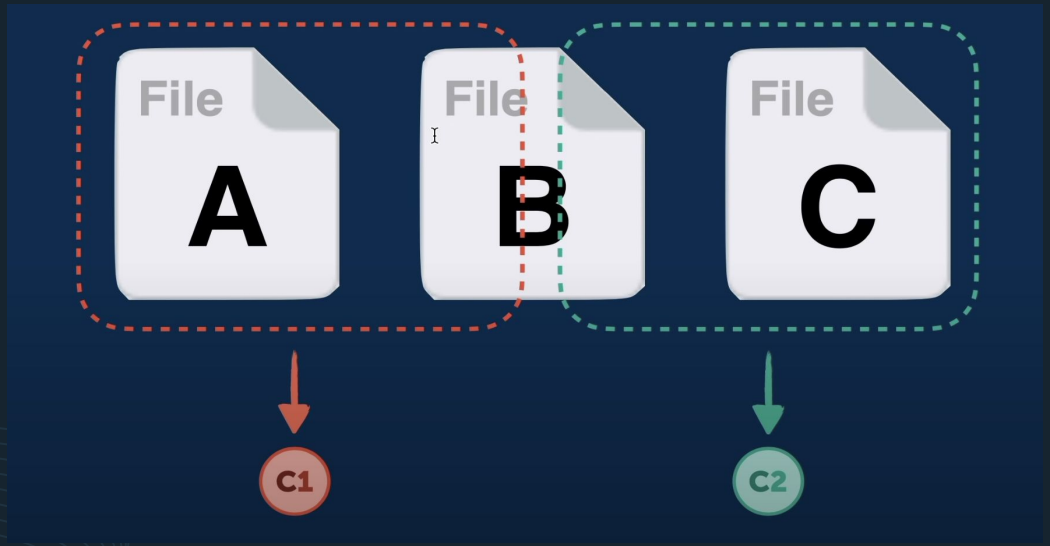
<ul>

   <li> Right changes </li>
   <li> Good commit message </li>

</ul>
```

slidesmania.com

A PERFECT commit



```
Only group changes from one topic to single commit.
```

slidesmania.com

Prefix for commits

```
build    - Build related changes (eg:adding external dependencies)
chore    - A code change that external user won't see
feat     - A new feature
fix      - A bug fix
docs     - Documentation related changes
refactor - A code that neither fix bug nor adds a feature
perf     - A code that improves performance
style    - A code that is related to styling
test     - Adding new test or making changes to existing test
```

A PERFECT commit

```
fix(middleware): ensure Range headers adhere more closely to RFC 2616

Add one new dependency, use `range-parser` (Express dependency) to compute
range. It is more well-tested in the wild.

Fixes #2310
```

Want to set up a perfect commit template?

1. Create a `.gitmessage` file in your home folder
2. Add whatever the perfect commit template and to above file and save it.
3. Run `git config --global commit.template ~/.gitmessage`
4. Setup your favourite code editor to open from terminal.

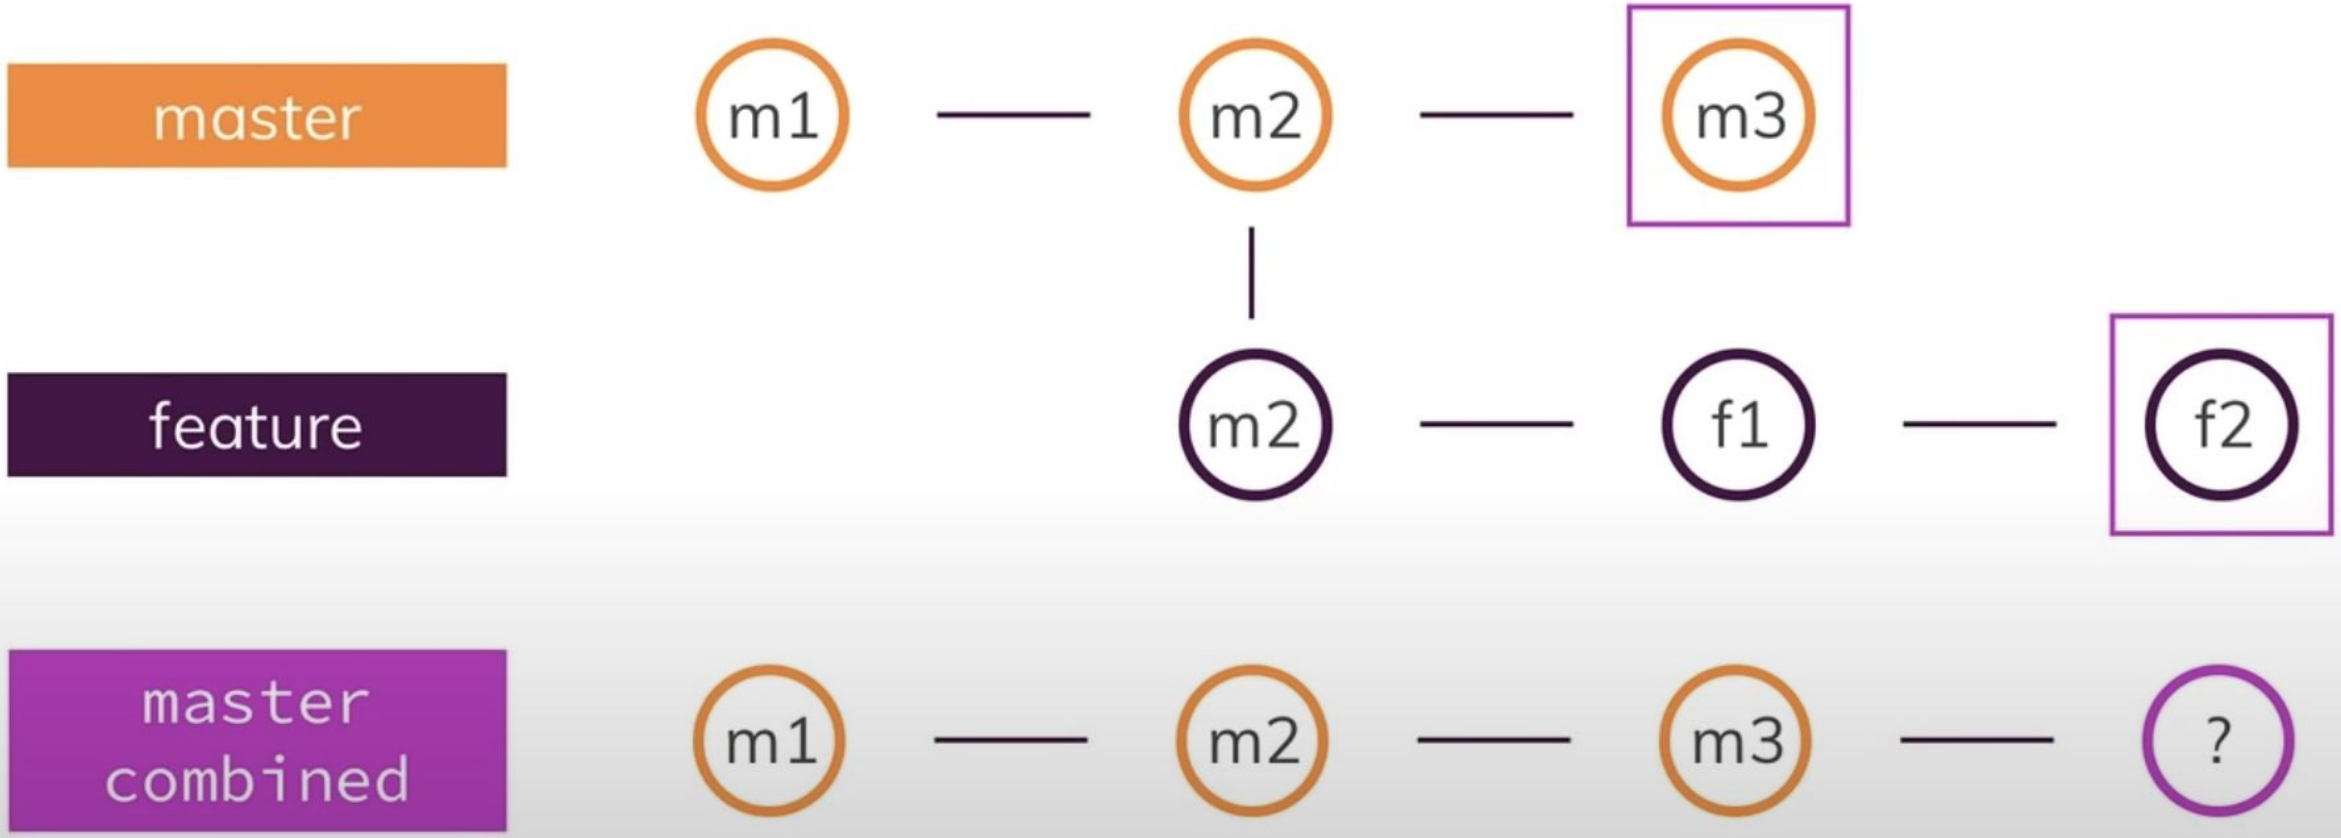
Let's TALK ABOUT git rebase vs merge

slidesmania.com



slidesmania.com

Trust me

Rebase ain’t scary.

slidesmania.com

slidesmania.com

DID YOU KNOW?

You can use rebase to fetch changes/commits or to update your branch from a source/trunk.

Also, you can use interactive rebase to

- Change a commit message
- Delete commits
- Reorder commits
- Combine multiple commits into one commit or to split an existing commit

slidesmania.com

Don’t use git rebase to manipulate commits that’s already shared/pushed to a remote repo

Technically they’re new commits.

cherry-picking.

Use only for integrating single specific commits, not as a replacement for merge or rebase.

Also, you can consider Spectre for cherry-picking.

Searching in git

```
--before/ --after    - to search by date
--grep               - to filter by a specific message
--author             - to filter commits by author
-- <file name>       - to filter the commits relevant to one file
```

`branch-one..branch-two` **- this will show you all the commits in branch-two that are not in branch-one**

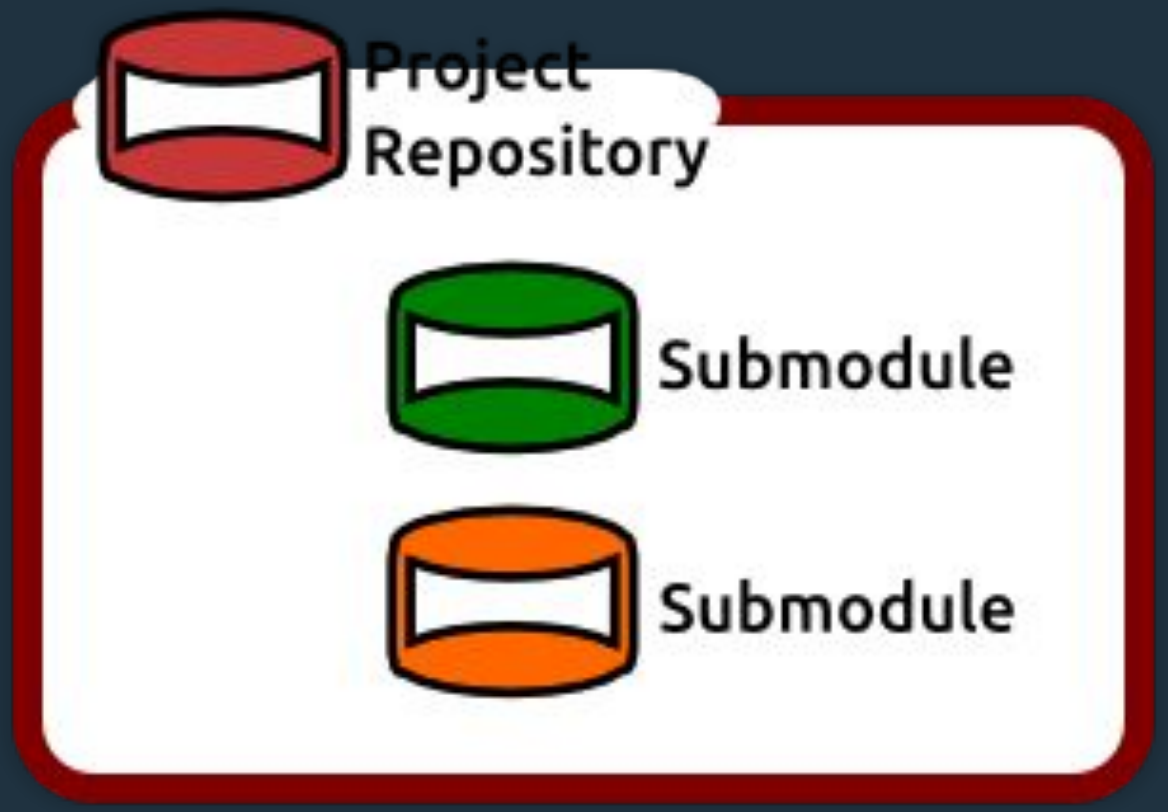
Reflog.

This can be considered as a journal for git. It snaps every movement of the HEAD.

Using reflog we can recover any previous state such as lost commits, deleted branches etc.

slidesmania.com



Let's

Integrate Manage Third-Party Code with Submodules

A git submodule is a record within a host git repository that points to a specific commit in another external repository.
