#BuildWithAIAuckland

Stitch BETA

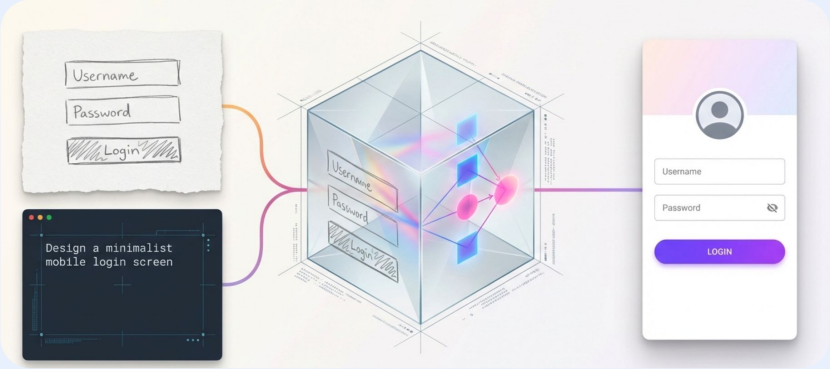
Google Stitch (Beta)

Raw intent to polished UI

AI powered UI design tool from Google Labs.

- Describe your UI in words or upload a sketch to get polished designs.
- Ability to iterate via feedback
- Uses Gemini under the hood
- Free, runs in the browser

stitch.withgoogle.com



Antigravity key features

Agent-First

Operates autonomously across the Editor, Terminal, and Integrated Browser.

Execution Modes

Planning Mode: Deliberate, step-by-step reasoning.

Fast Mode: Direct, high-speed execution.

Multi-Agent: Run parallel AI agents for simultaneous coding and testing tasks.

Artifacts

Structured, persistent summaries of what the agent did and its reasoning.

MCP

The Model Context Protocol enabling Antigravity to physically see external tools like Stitch.

Tool	Starting Point	Skill Level	Coding approach	Key feature
Google AI Studio	An idea you want to see, fast	Beginner. No coding experience needed	No code / Low Code	Single-prompt app generation with zero friction deployment
Google Antigravity	An engineering task or mission	Beginner to advanced	Agent-first / Autonomous	Mission Control for orchestrating autonomous agents across the editor, terminal, and browser.
Gemini CLI	Terminal based development	Intermediate to advanced	Terminal first / AI-assisted	Open-source agent for terminal-first "vibe" workflows

Flutter

03

Google's free, open-source UI framework for building **natively compiled**, **high-performance** applications for mobile (iOS, Android), web, and desktop from a **single codebase.**

Newcastle University

Prompting as a Process

1

Define your goal

Consider what it is you are trying to achieve and what output you want to be generated.

2

Draft an initial prompt

Prompting is an iterative process so you might need to experiment with different styles of prompt, but starting with an initial prompt gives you something to work from.

3

Test your prompt

Using a Generative AI tool appropriate for the task (e.g. text or image generation) test your prompt.

4

Evaluate the output

Now is the time to apply your critical skills. Consider the accuracy, relevance and reliability of the output. Has it achieved your defined goal. If not, now is the time to move to the next stage in the process.

5

Refine your prompt

Modify your prompt. You might include more context or detailed instruction, outline a different format to generate or change the focus of your task slightly.

Prompting is an iterative process where you will need to repeat the evaluate and refine steps until you get to the point where you are happy with the output.

Expand your prompt into multiple layers

[Give a role]
[Define the goal]
[Provide context]
[Does it need AI?]
[Create the vibe]
Optional : [Add a visual]

Good prompt

INSTEAD OF THIS

Help me build an app to track my food and water intake.

Powerful prompt

TRY THIS

You're an app builder who prioritizes good user experience. Create a web app that helps me track my food calories and water intake. I plan to use this app daily to count my calories and track my water intake and I want weekly summary. It would be good to use AI to track my calories if I can provide pictures of my food. Create a skeuomorphic vibe. Use the attached mockup for inspiration.

Stitch Prompts

You are a **UI/UX designer** specializing in modern mobile app design. Design the home screen for a tech events app called AKL Tech, built for the Auckland, New Zealand tech community. The app helps local developers discover upcoming meetups, conferences, and workshops in Auckland. The home screen needs a greeting header saying "What's happening in AKL" with a search bar at the top, followed by a horizontal scrollable section titled "Upcoming Events" with event cards showing event name, date, venue name, and a tech-themed thumbnail image. Below that, a "Speakers in Town" section with circular avatar cards of international speakers showing their name and talk topic underneath. Then a "Hot Topics" section with rounded tag chips: AI, Flutter, Cloud, DevOps, Cybersecurity, Web3, Mobile. **The visual style should feel sleek and premium use a dark navy (#0A1628) and electric blue (#2979FF) color palette** with white card surfaces and subtle card shadows for a modern, high-contrast look.

You are a UI/UX designer specializing in modern mobile app design. Refine the existing AKL Tech home screen designs to add more visual polish and better information hierarchy. The event cards need to feel more prominent and scannable, and users should be able to quickly identify the type of event at a glance. Make the event cards taller with more rounded corners (16px radius) and add a subtle blue glow/shadow effect. Add a small colored category badge in the top-left corner of each event card, green for "Meetup", purple for "Conference", orange for "Workshop". Make the speaker avatar circles slightly larger and add a thin electric blue border ring around them. The overall feel should stay consistent with the dark navy and electric blue palette but with more depth and visual richness.

Stitch Bonus Prompt

You are a UI/UX designer focused on engagement and social proof. Continue refining the AKL Tech home screen to make it feel more alive and interactive. Users are more likely to attend events when they see others are going too. Add a small attendee count with a people icon on each event card (e.g., "127 attending"). Make the hot topic chips have a subtle gradient fill in their default state so they look tappable. The overall vibe should feel premium and polished with more depth in the card shadows and generous spacing.

Note: above is an an optional prompt for additional refinement

Antigravity Prompts

You are a senior Flutter developer who writes clean, maintainable code. Use the Stitch MCP server to pull my AKL Tech designs and create a Flutter app that brings them to life. The app is a tech events hub for Auckland developers to browse upcoming meetups, conferences, and workshops. Build the home screen with a greeting header and search bar, a horizontal scrollable "Upcoming Events" section with event cards, a "Speakers in Town" section with circular speaker avatars, and a "Hot Topics" section with tag chips. Use clean architecture with separate folders for models, screens, widgets, and services. Use Material 3 theming with the dark navy (#0A1628) and electric blue (#2979FF) palette from the designs. Use mocked data for all events, speakers, and topics, include at least 8 events, 6 speakers, and 7 topic tags with realistic Auckland venue names and tech event titles. The app should feel polished from first launch add shimmer loading states for each section and match the Stitch layout exactly. Use my Stitch designs as reference.

Antigravity Prompt 02

You are a senior Flutter developer who builds intuitive navigation patterns. Add a bottom navigation bar with two tabs: "Events" (home icon) and "Speakers" (people icon). The Events tab is the existing home screen. The Speakers tab should show a full scrollable list of all international speakers with their circular photo, name, company, talk title, and a short bio. Users should be able to browse speakers independently from events and tap a speaker card to see a brief bottom sheet with their full details. Keep the styling consistent with the existing dark navy and electric blue theme so both tabs feel like part of the same app.

Antigravity Prompt 02

You are a senior Flutter developer who prioritizes responsive user interactions. Add a working search feature to the Events tab that filters event cards by event name and topic in real time as the user types. Developers attending multiple meetups need to find specific events quickly without scrolling. Show a friendly "No events found" empty state with an illustration if nothing matches. The filtering should feel instant and smooth add a subtle fade animation as cards filter in and out.

Antigravity Prompt 04

You are a senior Flutter developer who builds interactive, tactile UI components. Make the hot topic chips on the home screen tappable so they filter the events list to show only events matching that topic. Users browsing by interest (e.g., "AI" or "Flutter") should see results instantly. The selected chip should visually change to a filled/highlighted state, and tapping it again deselects and shows all events. The filtering should feel alive and responsive add a smooth list animation when events filter in and out.

Antigravity Prompt 05

You are a senior Flutter developer who sweats the small details that make apps feel professional. Add pull-to-refresh on the events list with a custom refresh indicator matching the dark navy theme. Add a countdown badge on each event card showing relative time "Today", "Tomorrow", "In 3 days", "Next week" based on the event date. Developers checking the app want to know at a glance which events are coming up soonest. Style the badge as a small rounded chip in the top-right corner of the card t should catch the eye without cluttering the layout.

Antigravity Bonus Prompt

You are a senior Flutter developer preparing an app for distribution. Build a release APK for Android with proper app branding. The app icon and splash screen should use the AKL Tech identity with the dark navy background and the app name prominently displayed. The splash screen should feel seamless when a user opens the app, the transition from splash to home screen should feel like one continuous dark navy and electric blue experience.

Note: above is an an optional prompt for additional refinement

Learnings from Stitch + Antigravity + Flutter

Prompt like a spec
Specify architecture & state management.

Be specific on colour
Use exact hex codes.

Say mocked data
Forces realistic data, not empty boxes.

Reference my Stitch designs
Triggers the MCP connection.

Name the architecture
e.g., MVVM, clean architecture.

Iterate, don't rewrite
Build progressively.

Multi-agent power
Run feature agent + test agent in parallel.

Stitch for stakeholders
Generate 5 variants quickly for buy-in.

Stitch + Antigravity + Flutter

Limitations

- Review generated code, it's a tool, not a replacement for understanding.
- Complex business logic still needs human judgment.
- Integrated browser is Chrome-only.
- Stitch has generation limits (Beta/Free).
- Save often, verify always.

"Use these where speed matters and correctness is easy to check. Be hands-on where the logic is subtle.

1. Described idea in words
2. Got polished Stitch UI
3. Prototyped without code
4. Connected via MCP
5. Agent built Flutter app
6. Prompted for features
7. Packaged for mobile

Every step of this used to take

hours or days.

Today it took

35 minutes.

“The gap between idea and app has never been smaller. Design it in Stitch. Build it in Antigravity. Ship it in Flutter. Go try it tonight.”

Thank you!
